

Fractals

In his seminal book *The Fractal Geometry of Nature*, Benoit Mandelbrot wrote, A cauliflower shows how an object can be made of many parts, each of which is like a whole, but smaller. Many plants are like that. A cloud is made of billows upon billows upon billows that look like clouds. As you come closer to a cloud you don't get something smooth, but irregularities at a smaller scale. In this collection of linked essays, William Bradley presents us with small glimpses of his larger consciousness, which is somewhat irregular itself. Reflecting on subjects as diverse as soap opera actors, superheroes, mortality, and marriage, these essays endeavor to reveal what we have in common, the connections we share that demonstrate that we are all fractals, in a sense self-similar component parts of a larger whole.

One result of being self-similar is that fractals can be described as having a fractional **none** A fractal is a never-ending pattern. Fractals are infinitely complex patterns that are self-similar across different scales. They are created by repeating a simple process over and over in an ongoing feedback loop. Driven by recursion, fractals are images of dynamic systems the pictures of Chaos. **Fractal art - Wikipedia** In mathematics a fractal is an abstract object used to describe and simulate naturally occurring objects. Artificially created fractals commonly exhibit similar patterns at increasingly small scales.
